

Map 3 Concept Management Maps – accessible text

Maps of land management plan concept showing FLS land holdings in Glen Doll and Glen Prosen.

Glen Prosen

Harvest windblow and mature crop – restructure plantation, for productivity in core area and integrate outer copes into surrounding landscape with variable density broadleaf planting.

Peatland restoration and drain blocking to slow flow of water

Deer management to reduce grazing pressure and facilitate natural regeneration

Fire resilience – mechanical vegetation control and grazing to reduce fuel load in open areas.

Future visitor car park and welcome information. Access to paths and tracks to experience woodland creation.

Native woodland creation to include: broadleaf planting alongside watercourses, varied density mixed woodland dispersing to low density wooded scrub and heath higher up the hill.

Conservation cattle grazing and open habitats for ground nesting birds in the lower glen, supported by open scrub habitat.

Glen Doll

Clear wind blown trees and transition high forest to more native mixed woodland that disperses up the hill into open scrub and montane heath. Scots pine, birch, rowan, aspen and hazel will feature to create a more diverse habitat that benefits wildlife and visitors alike. Deer management will continue along with new deer fencing around the forest block to enable restock and new planting to establish.

Enhance riparian zones with broadleaf planting to improve and shade the fresh water habitats.

Protect and expand montane habitats inc. rare arctic plant species on and around high crags.

Manage a small core of productive crop timber crop under Low Impact Silviculture where access and site conditions allow.

Visitor facilities – create new short trail to viewpoint behind Ranger Centre following windblow clearance. Support visitor infrastructure through sensitive forest management.
